are required between commands and options and between options and each argument. Commands must be typed in the proper case (nearly always lower case). Although each option to a command may be preceded by a "\-", with almost all of the standard commands you may put the options together. For example command -a -b -c -d can often be abbreviated as ...

BASIC UNIX COMMANDS

Linux is a clone of UNIX, the multi-user operating system which can be accessed by many users simultaneously. Linux can also be used in mainframes and servers without any modifications. But this raises security concerns as an unsolicited or malign user can corrupt, change or remove crucial data. For effective security, Linux divides authorization into 2 levels.

File Permissions in Linux/Unix with Example

For example, the Unix Bash shell command `mv *.txt textfiles/` moves (mv) all files with names ending in .txt from the current directory to the directory textfiles. Here, * is a wildcard standing for "any string of characters" and *.txt is a glob pattern. The other common wildcard is the question mark (?), which stands for one character.

[Unix / Linux - Useful Commands - Tutorialspoint](#)

Description. killall sends a signal to all processes running any of the specified commands. If no signal name is specified, SIGTERM is sent. Signals can be specified either by name (e.g., -HUP or -SIGHUP) or by number (e.g., -1) or by option -s. If the command name is not a regular expression (option -r) and contains a slash (/), processes executing that particular file will be selected for ...
