Geometrically, the differential equation $y' = 2x$ says that at each point (x, y) on some curve $y = y(x)$, the slope is equal to $2x$. The solution obtained for the differential equation shows that this property is satisfied by any member of the family of curves $y = x^2 + c$ (and only by such curves); see Figure 1. Figure 1

This book is a very good introduction to Ordinary Differential Equations as it covers very well the classic elements of the theory of linear ordinary differential equations. Although the book was originally published in 1961, this 1989 Dover edition compares very well with more recent offerings that have glossy and plots/figures in colour.

A basic understanding of calculus is required to undertake a study of differential equations. This zero chapter presents a short review. 0.1 The trigonometric functions The Pythagorean trigonometric identity is $\sin^2x + \cos^2x = 1$, and the addition theorems are $\sin(x + y) = \sin(x)\cos(y) + \cos(x)\sin(y)$, $\cos(x + y) = \cos(x)\cos(y) - \sin(x)\sin(y)$.

26.1 Introduction to Differential Equations. A differential equation is an equation involving derivatives. The order of the equation is the highest derivative occurring in the equation. Here are some examples. The first four of these are first order differential equations, the last is a second order equation.

When a differential equation involves a single independent variable, we refer to the equation as an ordinary differential equation (ode). Example 1.0.2. If there are several dependent variables and a single independent variable, we might have equations such as $\frac{dy}{dx} = x^2y$, $\frac{dz}{dx} = z \cos x$.
