In this process, we describe the magnetic dipole moment, m , the elementary magnetic quantity of interest in materials, and its volume average or magnetization, M , and establish the inter-relationship between these fundamental magnetic parameters: $B = \mu_0 (H + M)$ in SI, and $B = H + 4\pi M$, in the CGS system of units. Following these definitions and presentation of related conceptual ideas, we provide a general overview of the variety of magnetic behavior observed in different materials.

Introduction to Magnetism and Magnetic Materials | David ...

Magnetism is a class of physical phenomena that are mediated by magnetic fields. Electric currents and the magnetic moments of elementary particles give rise to a magnetic field, which acts on other currents and magnetic moments. Magnetism is one aspect of the combined phenomenon of electromagnetism. The most familiar effects occur in ferromagnetic materials, which are strongly attracted by magnetic fields and can be magnetized to become permanent magnets, producing magnetic fields themselves. D

Magnetism - Wikipedia

Introduction to Magnetic Forces and Fields Humans have long known of the existence of magnetic forces. Compasses relying on the magnetic field of the earth have been used for centuries as navigational aids. Until the nineteenth century, however, the cause and source of magnetic fields remained a mystery.

Introduction to Magnetic Forces and Fields: Introduction ...

Magnetism is defined as an attractive and repulsive phenomenon produced by a moving electric charge. The affected region around a moving charge consists of both an electric field and a magnetic field. The most familiar example of magnetism is a bar magnet, which is attracted to a magnetic field and can attract or repel other magnets.
