Through the use of new technologies, researchers, and practitioners in health education and health communication can now provide health information and behavior change strategies that are customized based on the unique needs, interests, and concerns of different individuals. These tailored health messages can be highly effective in assisting individuals in understanding and responding to health concerns. In this volume, Matthew Kreuter, David Farrell, and their colleagues define the process of tailoring and describe its uses in health communication programs. They present a theoretical and public health rationale for tailoring and support their position with empirical evidence. They also lay out the steps involved in creating and delivering tailored health communication programs, which can then be applied in practice. Practitioners, researchers, and students in health communication, health psychology, public health, and related areas will find this book to be a vital and invaluable resource for improving communication about health issues.

Internet research spans many disciplines. From the computer or information s- ences, through engineering, and to social sciences, humanities and the arts, almost all of our disciplines have made contributions to internet research, whether in the effort to understand the effect of the internet on their area of study, or to investigate the social and political changes related to the internet, or to design and develop so- ware and hardware for the network. The possibility and extent of contributions of internet research vary across disciplines, as do the purposes, methods, and outcomes. Even the epistemological underpinnings differ widely. The internet, then, does not have a discipline of study for itself: It is a ?eld for research (Baym, 2005), an open environment that simultaneously supports many approaches and techniques not otherwise commensurable with each other. There are, of course, some inhibitions that limit explorations in this ?eld: research ethics, disciplinary conventions, local and national norms, customs, laws, borders, and so on. Yet these limits on the int- net as a ?eld for research have not prevented the rapid expansion and exploration of the internet. After nearly two decades of research and scholarship, the limits are a positive contribution, providing bases for discussion and interrogation of the contexts of our research, making internet research better for all. These ‘limits,’ challenges that constrain the theoretically limitless space for internet research, create boundaries that give de?inition to the ?eld and provide us with a particular topography that enables research and investigation.
