Should you buy organic food? Is it just a status symbol, or is it really better for us? Is it really better for the environment? What about organic produce grown thousands of miles from our kitchens, or on massive corporately owned farms? Is "local" or "small-scale" better, even if it's not organic? A lot of consumers who would like to do the right thing for their health and the environment are asking such questions. Sapna Thottathil calls on us to rethink the politics of organic food by focusing on what it means for the people who grow and sell it—what it means for their health, the health of their environment, and also their economic and political well-being. Taking readers to the state of Kerala in southern

India, she shows us a place where the so-called "Green Revolution" program of hybrid seeds, synthetic fertilizers, and rising pesticide use had failed to reduce hunger while it caused a cascade of economic, medical, and environmental problems. Farmers burdened with huge debts from buying the new seeds and chemicals were committing suicide in troubling numbers. Farm laborers suffered from pesticide poisoning and rising rates of birth defects. A sharp fall in biodiversity worried environmental activists, and everyone was anxious about declining yields of key export crops like black pepper and coffee. In their debates about how to solve these problems, farmers, environmentalists, and policymakers drew on Kerala's history of and continuing commitment to grassroots democracy. In 2010, they took the unprecedented step of enacting a policy that requires all Kerala growers to farm organically by 2020. How this policy came to be and its immediate economic, political, and physical effects on the state's residents offer lessons for everyone interested in agriculture, the environment, and what to eat for dinner. Kerala's example shows that when done right, this kind of agriculture can be good for everyone in our global food system.

With rising population, decreasing agricultural productions and heavy use of chemicals in farming, access to fresh, safe and nutritious vegetables and fruits is getting harder by the day; especially so in urban areas. This has led to more and more people growing their own fresh vegetables at their homes in a worldwide movement known as 'grow your own'. A number of books also have been published on urban farming, but hardly any of them for Indian conditions and context. This book is a direct response to this knowledge gap. It starts with a discussion on current food situation around the world and establishes the context for and the importance of sustainable urban agriculture. Then Prabal takes the reader through various considerations one needs to make before starting one's own food garden. These considerations are important for planning and designing one's garden and are often ignored by inexperienced gardeners leading to monumental failures. In the next section all methods starting from container and potting mix preparation to soil maintenance and pest management are discussed with clear instructions. These methods and procedures have been tailor made for urban and semi urban areas

and urban life style. As a bonus section Prabal also gives ways to solve common problems in the garden with ingredients directly from the kitchen shelf.
