In the case of rapid growth, we may choose the exponential growth function:  $y = A_0 e^{kt}$  where  $A_0$  is equal to the value at time zero,  $e$  is Euler's constant, and  $k$  is a positive constant that determines the rate (percentage) of growth.

Exponential growth often causes this kind of surprising result, even when considering the vastly large orders of magnitude that come from space. At the end, we solved the equation.  $2^n = 3.91 \times 10^{12}$   $2^n = 3.91 \times 10^{12}$  but in a way that required we test out values using the sliders.
