Blow flies are considered to be diurnal insects and inactive at night [20, 33, 34]. However, some studies found nocturnal activity and even oviposition in blow flies [35–37]. In the current study, C. megacephala exhibited a diurnal activity, with a peak in the afternoon (12:00 to 18:00 h). However, the small-scale diurnal activity pattern of flies regarding the time of the day differs across seasons.

NORRIS Commonwealth Scientific and Industrial Research Organization, Canberra, Australia Blow flies (Calliphoridae) include species which cause great losses in the animal industry throughout the world, and some which are vectors of human disease (79). They are, in addition, an important element in the biota, and the study of their bionomics is therefore of considerable practical importance.

BACKGROUND: Chrysomya megacephala is a blow fly species of medical and forensic importance worldwide. Understanding its bionomics is essential for both designing effective fly control programs and its use in forensic investigations. METHODS: The daily flight activity, seasonal abundance related to abiotic factors (temperature, relative humidity ...

In any case, female-biased captures of flies in carrion-baited traps are usually expected (Avancini and Linhares 1988), and such area of bias is frequently considered (e.g., Hwang and Turner 2005; Baz et al. 2007). However, it must be taken into account that every collected carrion fly species does not necessarily show a female-biased sex ratio.

Sex-biased captures of sarcosaprophagous Diptera in ...
Blow flies are heavily attracted to dead carrion and other dead things. This is because the larvae of Blow flies burrow into and feed on the dead remains. Blow fly larvae need a lot of protein to develop and this is why dead meat is the preferred breeding ground. After 3 weeks to a month the Blow flies larvae will be fully grown.

Calliphora latifrons is one of the most forensically important species of blow flies. Urban entomology deals with the insects that affect humans and their immediate environment. This field includes a variety of problems for humans such as pest control issues and disease. C. latifrons is known to freely enter houses.

Calliphora latifrons - Wikipedia
During May 1991 a specimen of C. megacephala was incidentally captured near Beaufort West, Cape Province, South Africa, which prompted re-examination of blow-flies captured in the Kruger National Park during 1984. In this way it was found that C. megacephala was already well established in the south-eastern Transvaal by mid-1984.
