Parallel computing is a type of computation where many calculations or the execution of processes are carried out simultaneously. Large problems can often be divided into smaller ones, which can then be solved at the same time. There are several different forms of parallel computing: bit-level, instruction-level, data, and task parallelism.Parallelism has long been employed in high-performance ...

Parallel computing - Wikipedia

CUDA is a parallel computing platform and application programming interface model created by Nvidia. It allows software developers and software engineers to use a CUDA-enabled graphics processing unit for general purpose processing - an approach termed GPGPU. The CUDA platform is a software

layer that gives direct access to the GPU's virtual instruction set and parallel computational elements, for the execution of compute kernels. The CUDA platform is designed to work with programming ...

CUDA - Wikipedia

From a hardware perspective, a hybrid parallel architecture refers to the system consisting of a number of machines/PCs with distributed memory interconnected via a network, where each of the machine is a shared memory computer (like SMP) itself, as shown in Fig. 6 a. Thus, a hybrid distributed-shared memory computer is built by interconnecting a number of SMP machines via a network.
